<u>NOVELTY</u> The corresponding devices (32) are located in electronic markings (22) in the laundry items (18, 20) and are equipped to transmit data (18,20) stored in a data storage (30) of the electronic markings (22). <u>DETAILED DESCRIPTION</u> The transmitter/receiver (14) is connected to a control circuit featuring a comparison circuit (12) for verifying whether the received data of the electronic marking (22) corresponds to the properties of other laundry items and/or to the adjusted washing program of a washing or cleaning machine. A blocking or releasing signal is generated depending on the comparison result. The signal can be led to a display (12) or it controls the operation of the machine via the control circuit (12).	<u>ADVANTAGE</u> The device enables the dispensing of detergents, solvents, water or chemicals to be controlled in accordance with the number and type of laundry items in the are subjected to data collection. <u>DESCRIPTION OF DRAWING</u> The diagram shows a washing machine with an integrated data collecting device for laundry items. Corresponding device 32 Electronic markings 22 laundry items 18,20 Data storage 30 Receiver 14 Comparison circuit 12
